

Abstract

The function of the device (100) is to lock, manually or automatically, separative elements (8a, 8b) which are mounted so as to be rotatably and/or laterally movable, specifically, doors, windows, partitions, shutters and coverings, which have a base profile (4) which serves to accommodate a support device (2) by which a locking element (14) is retained, which element may be shifted between an unlock position and a lock position in which the locking element (14) engages a receptacle (91) fixed outside the base profile (4). According to the invention, the function of the support device (2) is to support a lever (1) which is provided with the locking element (14) and a head-piece (15) enabling operation in such a way that this lever (1) is retained in a rotatable fashion and is able to be detachably fixed in at least one first position corresponding to the unlock position, and possibly in a second position corresponding to the lock position.
